Lab 6 Dns

Started on all machines other than D
  --yum install bind-utils (for nslookup and dig to test dns)
  --machineD I added bind to the install
MachineD
   --change hostname to chase.dundermifflin.com (hostnamectl set-hostname)
All others
   --set to their new hostnames (router,platen,chase,roller,saddle).dundermifflin.com
    --hostnamectl set-hostname *.dundermifflin.com
MachineA
  --edit /etc/dhcpd/dhcpd.conf for all hosts and to use new dns server
  --made sure domain-name-servers, domain-search, domain-name were listed correctly
MachineD
  --restarted services, had problems, had to fix group on named.conf file to group named
  --added new dundermifflin.com file in var/named/ with the specifications provided
  --had to make dundermifflin.com. 5M an A record
  --and then www.dundermifflin.com a CNAME pointing to carriage server
  --used this to keep checking if setting were valid
   --named-checkzone dundermifflin.com /var/named/dundermifflin.com

had to go into each one and make sure NetworkManager was stopped and disabled
 -systemctl stop/disable NetworkManager

had to go into each machine and comment out the baked in dns servers in /etc/sysconfig/network

now all seem to be using machineD (chase) to ping locally dundermifflin and globally google
